Coffee sales operations with ChatGPT

REAL BUSINESS | LLM QA | HUMAN-IN-THE-LOOP | WORKFLOW DESIGN

Mohammad Muzamil

Contact: aztec.teknologi@gmail.com | Indonesia | Cases: August-September 2026

The problem

Informal orders led to connected administrative tasks: quantities, price tiers, invoice fields, payment matching, courier receipts and supplier accounting. I used ChatGPT as a supervised operational copilot in my coffee reseller business.

My contribution

I specified business rules and human-review boundaries, checked AI output against source evidence and corrected errors. A retained receipt episode shows two wrong readings and my numerical correction. The source SOPs document routing, safe batch processing, read-back and STOP conditions.

Target role	Demonstrated skill	Boundary
AI Evaluator /LLM QA	Source comparison, wrong-digit detection and arithmetic checks.	No accuracy benchmark or speedup.
Human-in-the-Loop	Correction, matching holds and explicit money classification.	No model-weight training.
AI Workflow	Supplier routing, persistent state and reconciliation controls.	No autonomous banking/courier deployment.

How to read this portfolio

Five case pages explain problems, AI outputs, human judgment and qualified results. Eight appendix pages reproduce redacted historical evidence at readable size. Internal links open the related appendix; accompanying Markdown and numeric extracts supply detail.

Important: payments/refunds are ledger or conversation recorded, not independently bank-verified. Source conflicts are retained. Reconstructions and later Antigravity/Work production are separately labeled. Prepared for human review; no publication has occurred.

Regular 250g Yek Ali	Medium	Premium
Retail below 20 combined	Rp15.000	Rp25.000
Wholesale from 20 combined	Rp13.000	Rp23.000
Supplier product cost	Rp10.000	Rp20.000
Retail /wholesale margin	Rp5.000 /Rp3.000	Rp5.000 /Rp3.000

The reseller absorbs the discount. Sastra uses separate product/size price snapshots and shipping policy. Native 32-field header read 14 October includes later TOPLES fields; it is not the exact schema of every August-September output.

Source hierarchy and execution

Project Instructions route tasks; Decision Log holds rules; supplier Workflow holds SOP; supplier ledger holds final state. Identify supplier/authority -> targeted read -> interpret all evidence -> check matching/duplicates/arithmetic -> batch writes -> read back -> reconcile or STOP.

Control	Purpose
Routine /conditional /heavy	Use targeted reads ordinarily; full relevant data and PRE-COMMIT for closing.
One logical bookkeeping unit	Write/read back all affected sources; partial failure means STOP. Database rollback is not claimed.
Separate states	Customer payment, supplier remittance, invoice eligibility and closing are distinct. Sastra default order is not mandatory.

Review gates

1 Commercial/invoice: quantities, threshold and supplier floor.
2 Shipping: source-grounded cost and payment method.
3 Output QA: compare reading and recompute item costs.
4 Closing: eligibility, separate flows and read-back reconciliation.

These controls describe the design. Selected artifacts demonstrate particular interventions, not universal compliance. Financial and physical execution stays human controlled.

Order to invoice: preserving the original billing state

Problem: An informal order needed an itemized bill, a separate supplier allocation, and an explicit shipping payment method.

Input/source: The historical invoice card records 2 Medium + 2 Premium. The original WhatsApp inquiry is not retained in the public package.

AI/output: ChatGPT generated the itemized card visible in EVD-03. It shows product subtotal Rp80.000, shipping Rp12.800 and TOTAL BAYAR Rp92.800.

Human judgment: My workflow requires checking quantities, pricing and shipping method before use. The retained evidence proves the invoice output and ledger values; it does not prove physical stock inspection or that this exact card was dispatched.

Outcome: The ledger records supplier obligation Rp60.000 and product margin Rp20.000. Later COD/refund notes describe a subsequent state; they must not replace the initial Rp92.800 invoice.

Product sales	Supplier cost	Product margin
Rp80.000	Rp60.000	Rp20.000

Limits: No historical SeaBank payment instruction, greeting or call-to-action is visible in this card. Dispatch and refund are not independently verified by bank or delivery receipts.

Source locator: Yek Ali Transaksi row 2; EVD-03. Private originals are not publicly accessible links.
EVD-03 appendix

Wholesale pricing without reducing supplier obligations

Problem: A mixed order qualifies for wholesale pricing only at 20 combined Medium and Premium packs. The reseller must absorb the discount.

Input/source: The native ledger records 10 Medium + 10 Premium. Any inquiry or sample invoice text here is a reconstruction from that row, not a retained historical chat.

AI/output: The supported calculation applies Medium Rp13.000 and Premium Rp23.000, while supplier costs remain Rp10.000 and Rp20.000. A sample prompt illustrates this delegation; the ledger alone does not prove every intermediate AI action.

Human judgment: The review criterion is both threshold and supplier floor: 20 combined packs qualify, customer sales are Rp360.000, supplier obligation is Rp300.000, product margin is Rp60.000.

Outcome: Payment time is recorded as 25 August 2026, 20:34:48 WIB; closing is 28 August 2026, 21:58:30 WIB, TB-003. These are different lifecycle events. Shipping Rp18.000 is recorded COD to courier.

Product sales	Supplier cost	Product margin
Rp360.000	Rp300.000	Rp60.000

Limits: This is a ledger-supported pricing episode, with no public original inquiry, dispatched invoice, stock audit or independent bank reconciliation.

Source locator: Yek Ali Transaksi row 27; Log business rules section 2. Private originals are not publicly accessible links.

Two incorrect receipt readings and a human correction

Problem: ChatGPT read a printed shipping total incorrectly twice, creating inconsistent billing amounts.

Input/source: EVD-01 is a physical receipt photograph with IDR27.200. It lists one parcel, not one retail coffee pack. The related order contains 4 Medium + 4 Premium.

AI/output: The first reading used Rp7.200 and total Rp167.200 (EVD-02). The retry used Rp72.000 and total Rp232.000 (EVD-04). EVD-05 shows the operator insisting on 27200 and the corrected Rp187.200 calculation.

Human judgment: I compared the response with the printed amount and corrected it. EVD-06 shows a hold on a Rp188.000 payment until payer matching was confirmed. The Rp800 excess is separately classified as customer donation in Arus Reseller.

Outcome: Sales Rp160.000 + shipping Rp27.200 = initial corrected bill Rp187.200. Ledger-recorded payment Rp188.000 creates Rp800 excess. The later ledger records COD to courier, shipping remitted to supplier Rp0 and refund notes.

Product sales	Supplier cost	Product margin
Rp160.000	Rp120.000	Rp40.000

Limits: Payment and refund are ledger/conversation-recorded, not independently bank-verified. No technical cause of the reading error is established. The evidence does not establish detection through parcel weight.

Source locator: EVD-01, 02, 04, 05, 06; Yek Ali Transaksi row 5, notes AB; Arus Reseller row 3. Private originals are not publicly accessible links.

EVD-01 appendix EVD-02 appendix EVD-04 appendix EVD-05 appendix EVD-06 appendix

Sastra: item-level validation and separate payment states

Problem: A second supplier has a different product catalog and shipping policy. Its obligations must not inherit Yek Ali rules or be confused with a different remittance batch.

Input/source: SC-20260928-004 contains four different 250g items. Native Detail Pesanan supplies the historical item prices; Master Harga has 48 entries across 100g, 250g, 500g and 1kg.

AI/output: ChatGPT-assisted administration is the workflow context. The retained ledger note labels the old Rp337.000/Rp34.000 aggregate as incorrect and records an audit correction. A historical transcript proving who produced or corrected that old aggregate at order time is not supplied.

Human judgment: The supported review is item-by-item arithmetic and supplier routing. This release QA recomputes 43.000 + 48.000 + 88.000 + 146.000 = Rp325.000. It does not attribute the later forensic correction to an undocumented historical action by me.

Outcome: Sales Rp371.000 - supplier product cost Rp325.000 = margin Rp46.000. Shipping Rp34.000 less subsidy Rp10.000 = Rp24.000. Related supplier obligation Rp349.000. Historical source status: MENUNGGU PEMBAYARAN.

250g item x1	Sales	Supplier	Margin
Robusta Premium	Rp49.000	Rp43.000	Rp6.000
Robusta Peaberry	Rp54.000	Rp48.000	Rp6.000
Arabika Honey Sumbing	Rp100.000	Rp88.000	Rp12.000
Arabika Luwak Specialty	Rp168.000	Rp146.000	Rp22.000

Limits: The separate 16 September remittance Rp219.000 concerns two earlier orders (Rp54.000 + Rp165.000), not settlement of the 28 September order. Bank settlement of the latter is not established.

Source locator: Sastra Transaksi row 5; Detail Pesanan rows 5-8; Master Harga; Workflow Sastra. Private originals are not publicly accessible links.

Closing QA: separate derived results from conflicted reports

Problem: Supplier obligations and reseller earnings were conflated in a historical closing report. Intermediate AI summaries could be mistaken for final accounting states.

TB-001, 6 transactions	Recorded/derived values
Medium +Premium	20+21=41 packs
Sales /supplier	Rp825.000 /Rp620.000
Product margin	Rp205.000
Donation /tips	Rp800 /Rp0
Ledger-derived reseller result	Rp205.800

Source conflict retained: the original closing summary shows 620.000 as gross/net reseller profit and donation 0. The 800 donation is in Arus Reseller. Cause unknown; originals unchanged.205.800 is not independently bank-reconciled profit.

TB-002	Earlier draft	Later native ledger
Transactions /packs	6 /41	14 /87
Supplier /margin	660.000 /175.000	1.530.000 /395.000
Donation /tips	0 /20.500	70.000 /20.500
Derived result	Rp154.500	Rp444.500

EVD-07/08 are NOT validated final closing records. Do not use the draft as settlement instructions. The public crop does not display the subsequent invalid-result warning. Later14-transaction values are ledger-supported, not bank-reconciled.

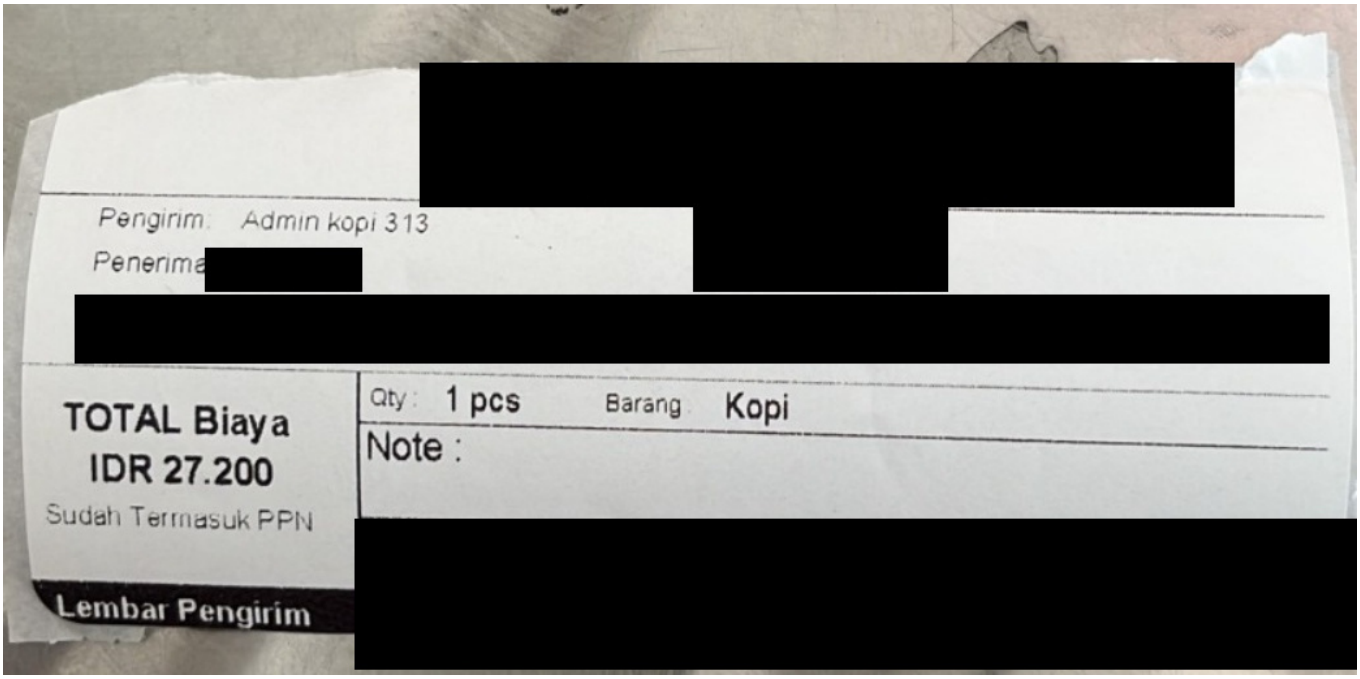

Review: source SOP requires PRE-COMMIT, eligibility and read-back. This release independently recomputes row totals; it does not certify every historical write.

Source locator: Yek Ali Transaksi rows 2-7; Laporan Tutup Buku E9, K3:L3, K4:L4, L14; Arus Reseller row 3; EVD-07/08. Private originals are not publicly accessible links.
EVD-07 appendix EVD-08 appendix

Printed receipt: IDR27.200

ORIGINAL RECEIPT / REDACTED PUBLIC COPY

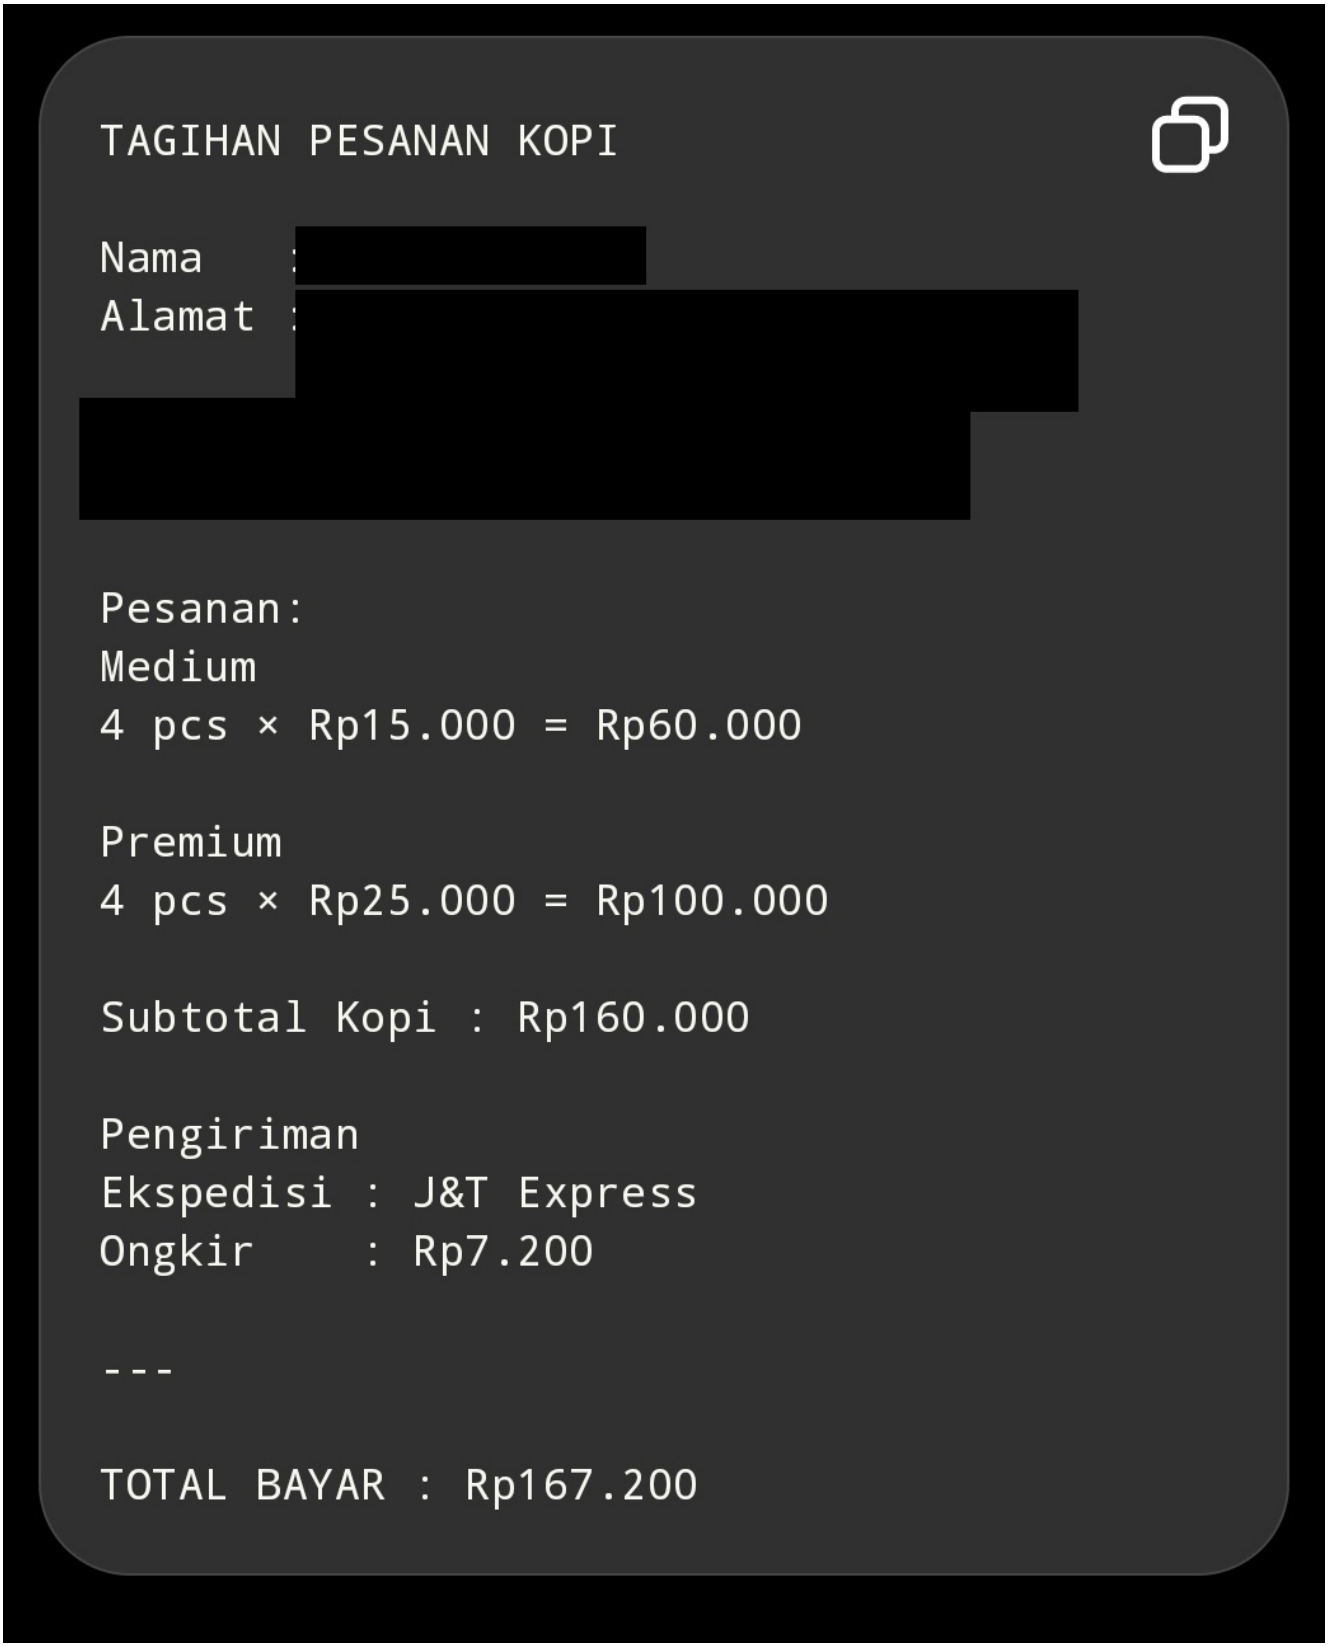

The printed total is Rp27.200. Qty 1 refers to a parcel. This is receipt evidence, not a bank record.

First wrong reading: Rp7.200

HISTORICAL AI OUTPUT / INCORRECT

The AI invoice shows shipping Rp7.200 and total Rp167.200. These are wrong outputs, retained for evaluation.

Original 2+2 invoice: Rp92.800

HISTORICAL AI OUTPUT / INITIAL INVOICE

The card shows subtotal Rp80.000 plus shipping Rp12.800. It does not prove dispatch, bank verification or a later COD invoice.

Second wrong reading: Rp72.000

HISTORICAL AI OUTPUT / INCORRECT RETRY

The retry shows shipping Rp72.000 and bill Rp232.000. Prior redaction obscures some prompt wording; the incorrect numbers remain visible.

Human correction: 27200

HISTORICAL INTERVENTION / CORRECTED BILL

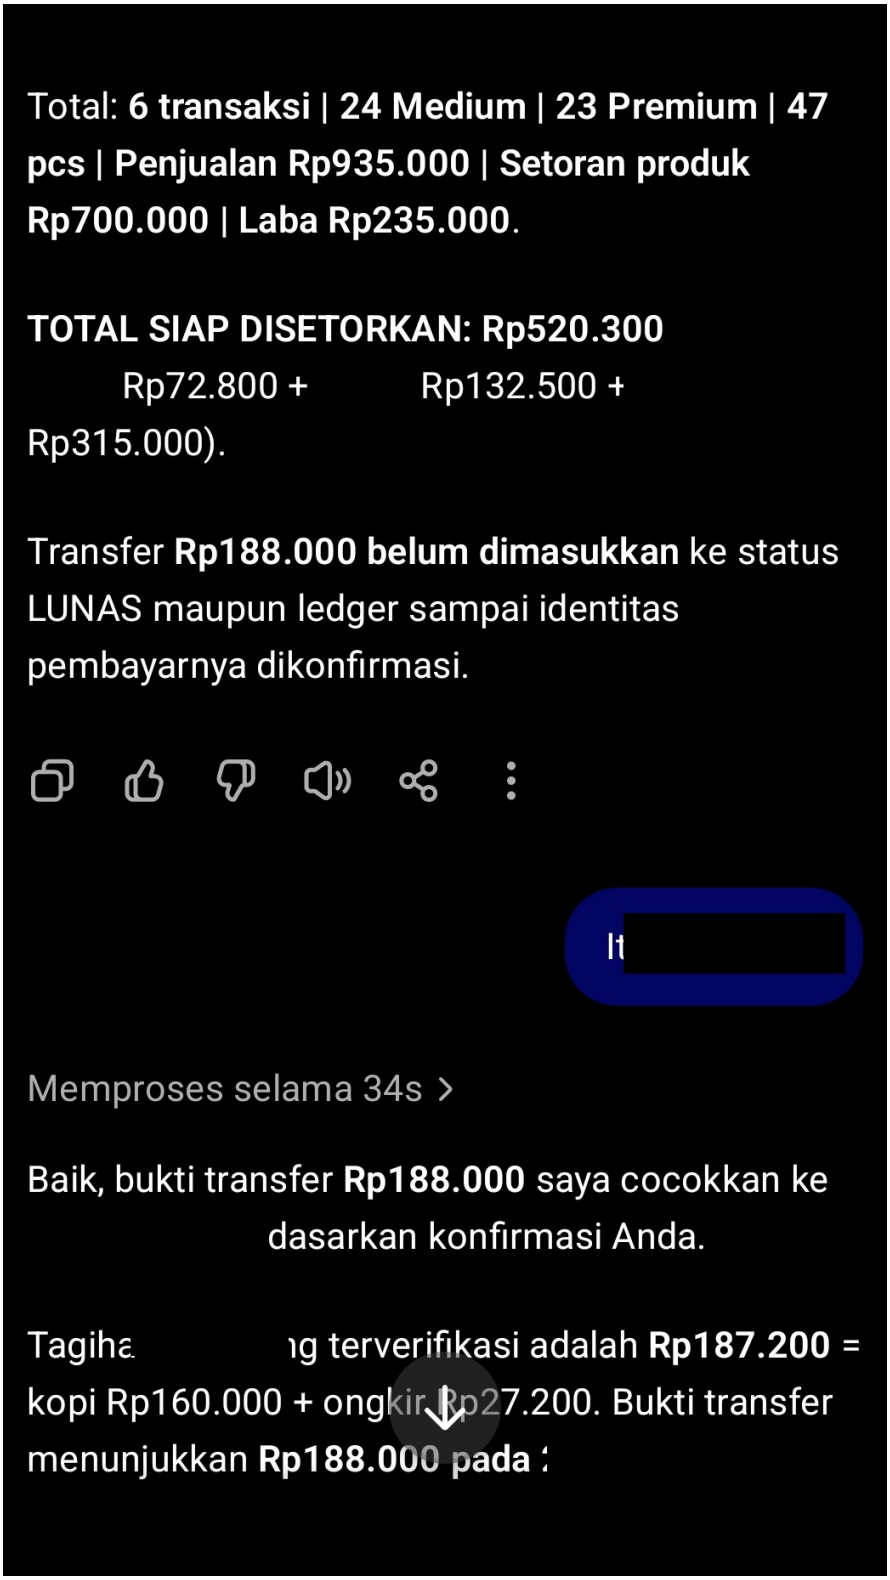

The operator specifies 27200 and the AI corrects the bill toRp 187.200. A nonessential profane word is partly masked; numeric evidence is unchanged. The supplier+freight figure is an intermediate state before later COD/refund notes.

Matching Rp188.000: conversation, not bank receipt

HISTORICAL CHAT / PAYMENT MATCHING

The chat holds the payment pending payer confirmation, then describes matching. The upper subtotal belongs to a separate working-state recap, not final TB-001. Exact date/time is masked; Rp800 is corroborated by the ledger, partly obscured at the screenshot bottom.

TB-002 six-transaction intermediate draft

INTERMEDIATE DRAFT / NOT FINAL

NOT a validated final report. The draft shows 6 transactions, supplierRp 660.000 and reseller resultRp 154.500. The later ledger has14 transactions. Do not use this image as settlement instructions.

INTERMEDIATE DRAFT - NOT FINAL SETTLEMENT EVIDENCE

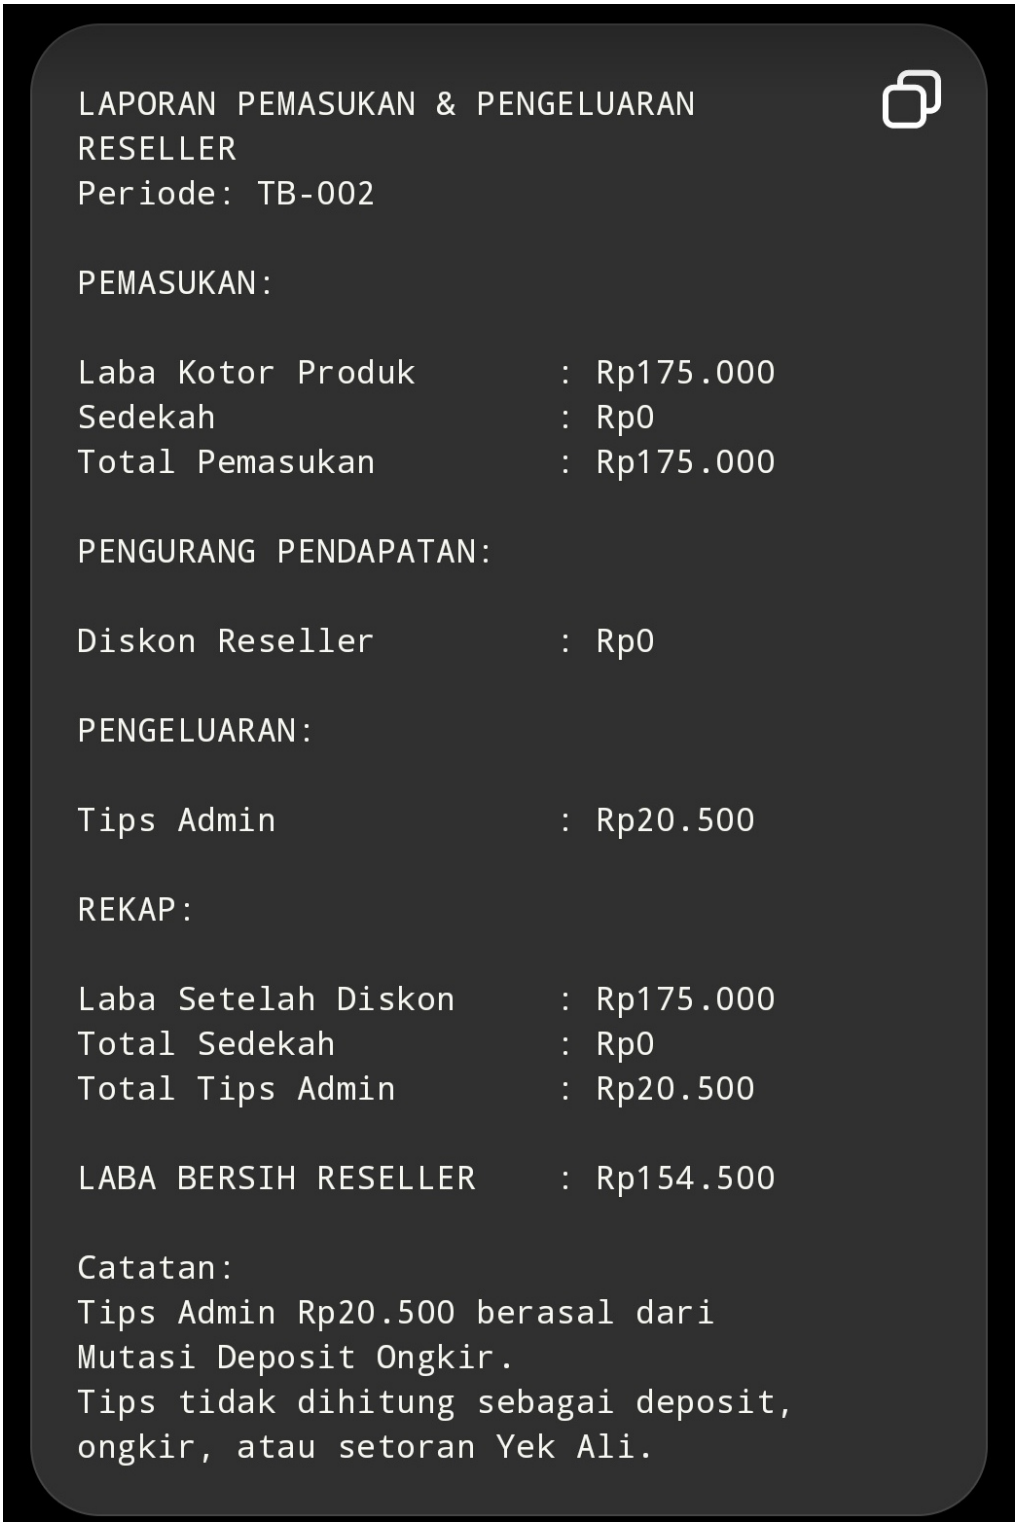

TB-002 draft margin and tips

INTERMEDIATE DRAFT / NOT FINAL

NOT a validated final report. Rp175.000 minus tipsRp 20.500 =Rp154.500 describes the earlier draft. The public image does not display the later invalid-result warning; this caption supplies the essential limitation, not a fabricated screenshot annotation.
